Nonetheless, modern geography is an all-encompassing discipline that foremost seeks to understand the Earth and all of its human and natural complexities – not merely where objects are, but how they have changed and come to be.

Geography has been called "the world discipline" and "the bridge between the human and the physical science". Geography is divided into two main branches: human geography and physical geography. Although many geographers are trained in toponymy and cartology, this is not their main preoccupation.

Geography is the science that studies the lands, features, inhabitants, and phenomena of Earth. A literal translation would be "to describe or write about the Earth". The first person to use the word "geography" was Eratosthenes.

Four historical traditions in geographical research are the spatial analysis of natural and human phenomena - geography as a study of distribution, area studies - places and regions, study of man-land relationship, and research in earth sciences.

Traditionally, geographers have been viewed the same way as cartographers and people who study place names and numbers.
